

[1]. Figure shows a long copper wire having radius  $R$ . The current density parallel to the cylindrical axis in the wire is given by

$$J(r) = \frac{r}{R}$$

where  $r$  is the distance from the cylindrical axis.

- (a) What is the total current passing through the wire?
- (b) What is the magnetic field at points where  $r > R$ ?

[2]. For the circuit given right, what is the magnitude of the current through the  $10 \Omega$  resistor?

[3]. Three long wires that are parallel to each other carry currents  $i_1 = 10 \text{ A}$ ,  $i_2 = 5 \text{ A}$  and  $i_3 = 20 \text{ A}$  respectively, shown in Figure. The distance between the wires is  $d = 10 \text{ cm}$ . Using unit vector notation, find

- (a) the magnitude and direction of resulting magnetic field,  $\mathbf{B}$ , acting on the second wire.
- (b) the the magnitude and direction of the resulting magnetic force per unit length acting on the second wire.

[4]. A charged particle of charge  $q$  enters a region of uniform magnetic field  $B$  with a kinetic energy  $K$  moving at right angles to  $B$ . The orbit radius of the particle is  $r$ .

Find an expression for:

- (a) the linear momentum of the particle in terms of  $B$ ,  $q$  and  $r$ .
- (b) the mass of the particle interms of  $B$ ,  $q$ ,  $r$  and  $K$ .
- (c) the angular momentum of the particle in terms of  $B$ ,  $q$  and  $r$ .

Constants:

$$e=1.6 \times 10^{-19} \text{ C}, \quad k=9 \times 10^9 \text{ N.m}^2/\text{C}^2, \quad \epsilon_0=8.85 \times 10^{-12} \text{ C}^2/\text{N.m}^2, \quad \mu_0=4\pi \times 10^{-7} \text{ T.m/A}, \quad 1\mu\text{C} = 10^{-6} \text{ C}$$
